

استاد: محمدعلی نعمتبخش دستیاران: فاطمه ابراهیمی، پریسا لطیفی، امیر سرتیپی

تمرین دوم: کار با دادههای حجیم درس: تحلیل سیستم دادههای حجیم

نام و نامخانوادگی: سعید صدیق زاده

آدرس گیت: آدرس نوتبوک در گیت ، آدرس سند در گیت

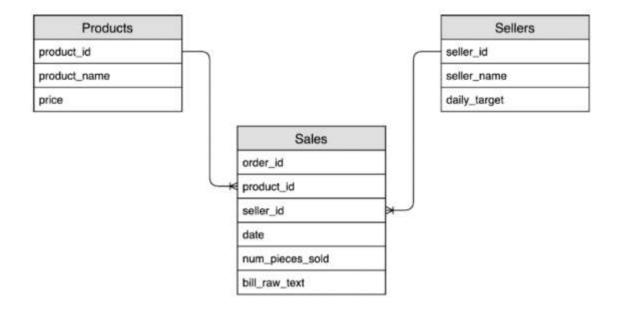

- لطفا پاسخ تمارین حتما در سامانهی کوئرا ارسال شود.
- لطفا پاسخهای خود را در خود سند سوال نوشته و در قالب یک فایل PDF ارسال کنید.
  - نام سند ارسالی {Name Family}-{student number}-
    - تمامی فایلهای مورد نیاز این تمرین در این لینک قابل دسترس است.
      - خروجی از هر مرحلهی تمرین را در سند خود بارگذاری کنید.
    - کد + سند را در گیت بارگذاری کرده و لینک آن را در سند قرار دهید.
      - لینک نوتبوک و مجموعهی داده

در این تمرین هدف ما آشنایی با دیتافریمها و کار با دادههای حجیم در موتور تحلیل spark است.

برای این منظور در ابتدا فایل دیتاست را به کمک قطعه کدی که در فایل نوت بوکی که در ادامه در اختیار شما قرار گرفته است، در دسترس خود با کمک زبان برنامه نویسی پایتون به سوالات مطرح شده در قسمت مربوط به همان سوال پاسخ دهید.

مجموعه داده مورد استفاده در این تمرین، از پایگاه داده یک فروشگاه، که شامل اطلاعاتی در رابطه با محصولات، فروش و فروشندگان، تشکیل شده است. نمودار رابطه موجودیت این مجموعه داده که در شکل-۱ نمایش داده میشود، هر کدام شامل فیلدهای زیر میباشند:

- $\sqrt{\text{product_name}}$ )، نام محصول (product\_name)، قيمت (product\_id)، قيمت (product\_name) محصولات (product\_name)،
- ✓ فروشنده (Seller): {کد فروشنده (seller\_id)، نام فروشنده (seller\_name)، مقدار فروش روزانه هر فروشنده
   ✓ (daily\_target)
- $\checkmark$  فروش محصولات (سفارشات):  $\{$ کد سفارش (order\_id)، کد محصول (product\_id)، کد فروشنده (seller\_id)، کد فروش محصولات فروخته شده (num\_pieces\_sold)، متن صور تحساب (bill\_raw\_text) $\}$

فایل فشرده این مجموعه داده در لینک زیر قابل دسترس خواهد بود که با کمک دستورات برنامه نویسی در محیط گوگل کولب فراخوانی شده و در گام اول از حالت فشرده خارج میشود تا بتوان به هر کدام از این جداول به طور مجزا دسترسی داشت.

سپس دادههای هرکدام از جداول را بررسی کرده و از آنها برای پاسخگویی به سوالات مطرح شده استفاده کنید.

## سوال ۱)

#### قطعه کد:

```
from pyspark.context import SparkContext
from pyspark.sql.session import SparkSession
from pyspark.sql.functions import *

sc = SparkContext.getOrCreate();('local')
spark = SparkSession(sc)
products_data = spark.read.option("mergeSchema", "true").parquet("/content/products_parquet")
sellers_data = spark.read.option("mergeSchema", "true").parquet("/content/sellers_parquet")
sales_data = spark.read.option("mergeSchema", "true").parquet("/content/sales parquet")
```

```
products data.printSchema()
sellers data.printSchema()
sales data.printSchema()
                                                                      خروجي:
root
|-- product id: string (nullable = true)
|-- product name: string (nullable = true)
|-- price: string (nullable = true)
root
|-- seller id: string (nullable = true)
|-- seller name: string (nullable = true)
|-- daily target: string (nullable = true)
root
 |-- order id: string (nullable = true)
 |-- product id: string (nullable = true)
|-- seller id: string (nullable = true)
 |-- date: string (nullable = true)
 |-- num pieces sold: string (nullable = true)
 |-- bill raw text: string (nullable = true)
                                                                        الف)
                                                                      قطعه کد:
print('Products Number:',products data.count())
print('Sellers Number:', sellers data.count())
print('Sales Number:', sales data.count())
                                                                      خروجي:
Products Number: 75000000
Sellers Number: 10
Sales Number: 20000040
                                                                      قطعه کد:
sales data.select(countDistinct("product id")).show()
                                                                      خروجي:

             99662|
|2020-07-10|
             98973|
+----+
```

سوال ۳)

قطعه کد:

```
saled_products=products_data.join(sales_data,["product_id"])
SP_with_income=saled_products.withColumn('in-
come', col("price")*col("num_pieces_sold"))
SP_with_income.agg(avg(col("income"))).show()
```

### خروجي:

```
+-----+
| avg(income)|
+-----+
|3808.9944235473604|
+-----+
```

توجه: در این سوال که به انجام عملیات join بین جداول sales و product (که جداول حجیمی هستند) نیاز است، متا سفانه خطاهای مختلفی رخ می داد که نمونه ای از این ارورها پس از اجرای عملیات join، در پیو ست این تکلیف، قید شده است. این در حالی است که در صورت حذف برخی از رکوردهای هر یک از این دو جدول (که از طریق حذف برخی فایل پارتیشنهای دیتاست، قطعه کد مذکور به در ستی و فایل پارتیشنهای دیتاست در دو جدول مذکور انجام شد)، با هدف کاهش حجم دیتاست، قطعه کد مذکور به در ستی و بدون خطا اجرا می شد و نتیجه مربوطه را تولید می کرد. لذا خروجی نمایش داده شده بالا، مربوط به اجرای کد بر روی زیرمجموعه ای از دیتاست مورد بررسی در دو جدول مذکور است. این مشکل عینا در مورد سوال ۵-الف هم وجود دارد و در آن سوال نیز که نیاز به join کلیه جداول دیتا ست وجود دارد، کدها روی زیرمجموعه ای کم حجم تر از نسخه ا صلی دیتا ست اجرا شده اند. بنابراین در هر دوی این دو سوال، تفاوت مقادیر و نتایج با نتایج مورد انتظار، به این علت است که کدها روی مجموعه داده کامل اجرا نشده اند و برخی از رکوردها در دو جدول حذف شده اند تا خطای مورد اشاره رخ ندهد.

در مورد خطاهای دریافتی در هنگام اجرای join بر روی کل جداول ذکر این نکته ضروری است که پارامترهای مختلفی که در این نمونه خطا قابل مشاهده است، هر بار و در اجراهای مختلف متفاوت بود. جستجوهای مختلف بر روی این خطا نیز، نشان داد که چنین خطایی منشاء نامشخصی دارد که ظاهرا به محدودیتهای پرداز شی و حافظه مرتبط است (که اجرای صحیح کدها در نسخه کم حجم تر مجموعه داده نیز موید همین موضوع است). با این حال سعی شد تغییرات مختلفی از جمله آزمودن روشهای مختلف جهت load داده ها از فایلها، آزمودن روشهای مختلف این پکیجها با یکدیگر) و نسخههای مختلف این پکیجها با یکدیگر) و غیره در کدها صورت گیرد تا منجر به رفع این مشکل شود، که هیچ یک از آنها باعث اجرای بدون خطای توابع غیره در کدها صورت گیرد تا منجر به رفع این مشکل شود، که هیچ یک از آنها باعث اجرای بدون خطای توابع aggregate

## سوال ۴)

نکته: در این سوال نسبت تعداد محصولات فروخته شده (ستون num\_pieces\_sold) در جدول سفارشات به مقدار کل فروش مورد انتظار هر فروشـنده (سـتون daily\_target) در جدول فروشـندگان محاسـبه شـده و به عنوان درصـد سـهم سفارش برای هر فروشنده در نظر گرفته شده است.

#### قطعه کد:

```
sellers_orders=sellers_data.join(sales_data,["seller_id"])
SO_with_share=sellers_orders.withCol-
umn('share', (col("num_pieces_sold")/col("daily_target"))*100)
SO_with_share.groupBy("seller_id").agg(avg("share").alias("order share")).show()
```

#### خروجي:

## سوال ۵)

نکته: در این سوال فرض بر این بوده است که منظور از پرفروش ترین فرو شنده، فرو شنده ای با بیشترین درآمد از فروش محصولات خود است. در واقع معیار پرفروش بودن، درآمد بالاتر فرض شده و نه تعداد کالاها و غیره. به همین جهت از جدول تشکیل شده در سوال ۳ (SP\_with\_income) که حاصل ضرب قیمت در تعداد فروش به عنوان درآمد در یک ستون اضافی محاسبه شده بود، استفاده شده است.

#### قطعه کد:

```
all_tables=SP_with_income.join(sellers_data,["seller_id"])
```

#### خروجي:

در این قطعه کد برر سی شد که هر یک از مقادیر hash تولید شده، دارای چه تعداد رکورد سفارش هستند. در واقع اگر این مقدار بیش از عدد یک با شد نشاندهنده این است که رکوردهایی وجود دارد که مقدار ستون hashed\_bill برای آنها یکسان است. نتایج نشان میدهد که هیچ یک از این مقادیر بیشتر از عدد ۱ نشده است، بنابراین hash هیچ یک از ستونها با یکدیگر یکسان نیست.

### يپوست:

نمونه ای از خطای مذکور در سـوال  $\pi$ ، که در صـورت کاهش حجم دیتاسـت در دو جدول sales و products این خطا برطرف می شد و نتایج قید شده در سوال  $\pi$  و سوال  $\pi$ - الف به دست می آمد. مجددا تاکید می گردد که پارامترهایی که در متن خطای زیر نشان داده شده ثابت نبود و در اجراهای مختلف، مقادیر متفاوتی را نشان می داد. ضمن اینکه هر بار پس از اینکه این خطا به وقوع می پیوست، اتصال دیبا  $\pi$  گوگل کولب قطع می شد و نیاز به راه اندازی مجدد داشت.
